FARM EMPLOYMENT ABOUT THE SAME AS YEAR AGO WORK PROGRESSES SLOWLY

There were 10,280,000 people at work on farms throughout the country on May 1, about the same as a year ago, the Bureau of Agricultural Economics reported today. A late season and unfavorable weather were largely responsible for keeping farm employment at the 1946 level.

Spring work on farms has been delayed by continued cold, wet weather except on the Pacific Coast. Plowing and seeding operations were 2 to 3 weeks later than usual. By May 1 last year oats were practically all planted in the Northeast and North Central States and much spring plowing completed. This year many acres intended for oats were still unplanted on May 1 and very little plowing completed for corn and other crops. In the South, planting of cotton, corn and tobacco was behind schedule.

The number of persons at work on farms on May 1, was about the same as a year ago in most regions except for a decrease in the East and West South Central States, and an increase in the West North Central States. In the South Central States, rains the last week of April in the southern part of the region and low temperatures and wet soil in the northern part hindered field work. In the West North Central States delayed work was progressing except in a few areas where fields were still wet.

There were about 100,000 fewer operators and unpaid members of their families doing farm work this year on May 1 than a year ago. Fewer family workers were doing farm work in all regions except the East and West North Central and the Pacific States where there were more and in the New England States where there was no change. Changes ranged from 1 to 4 percent. A few more hired workers were employed on May 1 than a year ago for the country as a whole. There were decreases in only the South Central and the Pacific States.

Over a million more persons were at work on farms on May 1 than on April 1. The seasonal increase in the number of family workers was less than usual but about normal for hired workers. Seasonal increases were about the same as usual in all regions except the South Central States which had

less increase than usual. Last year when work was well advanced seasonal increases were larger than usual.

Field operations in the New England States were getting underway slowly by May 1. Very little plowing had been done and there had been no spring seeding except on the lighter soils. Some hardy vegetables were being set in favorable locations. About the same number of family and hired workers were employed as on this date last year.

In the Middle Atlantic States, the number of persons at work on farms on May 1 was about the same as last year, after a usual increase during April. There were fewer family workers than a year ago but an increase in the number of hired workers. Field work in New York and Pennsylvania was proceeding slowly after a late start. In New York in general only light soils were in shape for preparation for seeding. Muck soils were being prepared for potato planting. In northern New Jersey farmers were planting oats and preparing corn ground as rapidly as frequent rains permitted. In South Jersey asparagus cutting and tomato transplanting were starting about 2 weeks later than usual. Spraying of fruit trees was a job common to the whole region.

Spring work was making little progress in the East North Central States. Excessively wet, cold weather in April gave farmers little opportunity to work in the fields and hence by May 1 farm operations were two to three weeks later than usual in most of Illinois, Indiana and Ohio. Much oat seeding had been delayed and there was very little plowing for corn or soybeans. Fruit grovers were busy spraying trees by the last week in April. The number of farm workers was slightly greater than last year. Hired workers increased about 28 percent since April 1, somewhat more than the usual seasonal increase.

In the West North Central States there were 3 percent more workers on farms than last year. All of this increase was in family labor. Seasonal increases from April were about as usual. Wet, cold weather, with some snow in North Dakota, greatly delayed field work. Only in western Kansas and Nebraska were farmers making any progress with spring work. Corn planting and seeding spring sown grains were the main activities around May 1. Alfalfa was being cut for dehydration in southern Kansas.

The number of persons employed on farms in the South Atlantic States on May 1 was up 17 percent from last month but practically the same as a year ago. The slight decline in the number of family workers was offset by an increase in hired labor. The unseasonably cold weather during April delayed plantings and the preparation of seedbeds. A very short crop of spring vegetables was being harvested in Florida and most field crops were delayed or getting a late start in Georgia. By the first of the month farm hands were setting tobacco, and starting cultivation of cotton and truck crops in the Carolinas. In Virginia cotton planting was well underway and many farmers were busy preparing ground for corn, peanuts and soybeans. Migrant labor began their northward movement somewhat early this year as a result of the light spring harvest in Florida.

Both family and hired workers showed 4 percent declines from last year in the East South Central States. In the northern part of the region frequent rains prevented field work resulting in many weedy fields following plowing. Farmers in most sections were nearly 3 weeks behind with their spring work. Farther south in Alabama and Mississippi April rainfall was considerably above average. But by the first of May such operations as chopping cotton, cultivating corn, transplanting sweetpotatoes and picking strawberries were in full swing. Harvest of the short commercial potato crop in Alabama was about to start by May 1.

The number of workers on farms in the West South Central States was also less than last year. Weather around the first of the month further delayed planting operations in the northern part of the region and hindered cultivation of crops in the South. Most of the corn and cotton had been planted in Louisiana. Spring vegetable harvest was active in south Texas but field work made rather slow progress over the rest of the state during the latter part of April. Most crops are later than usual. Corn, cotton, sorghum and peanut planting was underway in Oklahoma. First cuttings of hay were ready but farmers were waiting for favorable curing weather. In Arkansas most spring planting had been delayed somewhat by excessive soil moisture. Strawberry harvest will soon be underway in the White County area of Arkansas.

Farm employment increased about as usual in the Mountain States. A 9 percent increase in hired workers (compared to last year) more than made up for a slight decrease in the number of family workers on farms. In Arizona and parts of Nevada and New Mexico a continuation of above-normal temperature with negligible amounts of rain-fall did not aid the already critically low irrigation water supply. Dry-land farming areas in these States needed moisture badly. In Utah and Idaho the main farm activities were thinning beets and onions, thinning and blocking lettuce, potato cutting and planting and spraying fruit orchards. Spring grain seeding was progressing favorably over most of the region. Importation of Spanish-Americans and Mexican Nationals into the sugar beet areas had already started.

Above normal temperatures have prevailed in the Pacific Coast States and, except for dry land areas in California, soil moisture has been adequate. So farm operations were well ahead of their usual schedule. Practically the same number of workers were employed on May 1 as a year ago. Shearing sheep, irrigating and spraying fruit trees, harvesting asparagus, weeding peppermint, planting potatoes, peas and corn were the main farm jobs in Washington and Oregon around May 1. In California, current operations requiring large numbers of seasonal workers included the cultivating, irrigation and harvesting of commercial vegetables, citrus harvest in the southern part of the state, and thinning apricots, plums, and early peaches. Hay harvest and baling had begun in some areas, as had the harvesting of grain and flax.
